

DJ HORSE WATERER

INSTALLATION INSTRUCTIONS

The waterer body (A) has a hole in the bottom to mount the valve. The mounting tube (B) is designed to be inserted vertically in the ground. We recommend it be buried at least 2 1/2 ft or below frost line, whichever is deeper.

To plumb the DJ Horse Waterer we advise you not to set (B) directly on your horizontal supply line, rather put some dirt on top of the line or put a block in the bottom of hole for (B) to sit on. Run your vertical supply line up through (B) to the level of ring near the top of (B) and there install a shut-off valve. From the shut off-off valve to the waterer valve we use a flexible toilet supply line which is available at most hardware stores. The waterer valve has a 7/8" inlet.

After connecting the water supply to the waterer valve set (A) on (B) must sit directly on the horizontal ring prior to inserting the self tapping screw. Adjust water level with screw on waterer valve.
